## DETAILED ACTION

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

Claims 1-12,14,15,17,18. 20, 21, and 25-42 are rejected under 35 U.S.C. 102(e) as being anticipated by US Patent No. 6,659,203 to Cruickshank et al.

Cruickshank et al discloses a lockable motor assembly for use in a well drilling or window milling (col. 1, lines 16-41), which comprises all of the claimed structure and method of using the same including a stator 3, a rotor 4 rotatably mounted within the stator. The selectively removable flow restriction is met by the nozzle 33 disposed within a fluid passageways19, which is anticipated to be selectively removable by mechanical means, as the nozzle is chosen to have specific aperture 34 allowing fluid flow therethrough to set a downstream downhole tool such as a packer or anchor,

without releasing the holding means 12 (Fig. 1, col. 5, lines 33+, and col. 4, lines 24+). The selectively releasable holding means for preventing rotation of said rotor is met by the locking member 12 which locks the rotor 4 to the stator 3 in run-in position ( Fig. 1, and col. 4, lines 45+), and releases from the rotor at a predetermined differential pressure in an operational position as shown in Fig. 6, and col. 4, line 57-col. 5, line 32, where a predetermined pressure differential is applied to shear the shear ring 23. The PDC drill bit is anticipated in a well drilling or casing milling, as it has been a known industrial standard practice.

***Allowable Subject Matter***

Claims 13, 16, 19, 22-24, 43, 44 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claims 45-65 are allowed.
